About the Builder

Pushpender

ML Engineer · India Runs Hackathon Participant

- Built the **Track 1 AI ranker** — scoring 100K candidate profiles for Redrob's Senior AI Engineer role using multi-signal ML scoring
- From that work: **the hardest problem is not ranking candidates who have profiles — it's that 93% of India's workforce has no profile at all**
- **Bharat Score** is the direct upstream solution: create the structured data that Redrob's ranker then uses

"I built the ranking engine. Now I'm building the input."

Contact: rpyaduvanshi950@gmail.com | +91-9257009192

The Problem: 450 Million Workers Without a Verifiable Identity

India's informal sector is **the world's largest unverified talent pool**.

- **450M** informal workers — daily wage, gig, small-trade, migrant
- **93%** of India's workforce has no verifiable employment record
- **Only 50M** Indians have a LinkedIn profile (3.5% of 1.4B population)
- A mason who built an airport cannot prove it to get his next contract
- A data-entry worker in Patna applies to a BPO in Pune — recruiter sees a blank profile

Recruiters spend 40% of screening time trying to verify claims they can't actually verify.

The result: good workers are invisible and bad claims go unchallenged

The Insight: Voice Is the Universal Interface

91% of India's mobile users access the internet primarily through voice or video.

WhatsApp has **500M+ active users in India** — including workers with no email address.

We don't need to build a new app.

We need to meet workers **where they already are.**

The credential system that works for India must be:

- **Voice-first** — not form-first
- **Vernacular** — 12 Indian languages, not just English
- **Zero-friction** — no app download, no account creation
- **Instantly verifiable** — a QR code that any recruiter can scan right now

Introducing Bharat Score

One WhatsApp conversation → a verified work credential

Worker texts "SCORE" to +91-XXXX-XXXXXX

Redrob AI bot responds in their language:

"Namaste! Main aapka kaam ka certificate banaunga.
Aap kya kaam karte hain?"

[5-minute voice/text conversation]

Worker receives a shareable link:

bharat.score/w/RJ-MASON-2847

Ramesh Jatav

★★★★★ Mason - Level 4

12yr · RCC + Tiling

Verified: 3 employers

Last active: June 2026

How It Works: The 5-Step Pipeline

The AI Assessment: What We Actually Measure

Not a quiz. A conversation.

The AI adapts questions based on the claimed role:

For a Mason	For a Delivery Driver	For a Data Entry Worker
"Cement-to-sand ratio for RCC?"	"What do you do if a parcel is wet?"	"How many invoices per hour?"
"How do you check plumb line?"	"Describe your GPS app workflow"	"Which Excel formula for totals?"
Employer contacts (spoken)	GSTIN/license number	Typing speed (live test)

Bharat Score = 0.40 × skill assessment + 0.35 × verified tenure + 0.25 × employer ratings

Scores update with each verified credential. **It's a living document, not a snapshot.**

Why Now: Three Tailwinds Converging

1. WhatsApp Business API opened to developers (2023)

Any verified business can now build conversational flows — no special access needed.

2. Indic LLMs have crossed the viability threshold

Sarvam AI's Saaras (Hindi/Tamil/Telugu), **AI4Bharat's IndicBERT**, and **OpenAI Whisper** (12 Indian language transcription) all run at production quality.

3. ONDC + PMKVY-3.0 created the demand signal

Government procurement rules now **require skill certificates** for contractors.

MSME owners need credentials to bid for government projects.

The demand is there. The supply (verifiable credentials) is not.

Market Sizing

India's informal workforce addressable universe:

450M workers × 30% smartphone + WhatsApp penetration
= 135M addressable workers

Target Year 1: 2M credentialed workers (1.5% penetration)

Target Year 3: 20M credentialed workers

Revenue model: B2B2C

- └─ Recruiter seat access: ₹2,000/month per seat (ATS integration)
- └─ Background verification: ₹49/check (pay-per-use)
- └─ Premium worker profile: ₹99/year

Year 3 blended ARR potential: ₹80–120 Cr
(20M workers × blended ARPU + recruiter seats)

Competitive Moat

What exists today	What Bharat Score adds
LinkedIn — English, degree-focused	Vernacular, skill-work-focused
NSDC / PMKVY — one-time certificate	Dynamic score that updates with work history
CIBIL / credit score — financial only	Work reputation score
Reference checks — slow, biased	AI-structured, consistent, instant
Springworks / Keka — corporate HR	Informal sector, zero-infrastructure

The moat is the data flywheel:

More credentialed workers → more recruiter trust → more workers self-credential
→ richer assessment benchmarks → better scores → more recruiter trust.

Early entrant advantage is decisive in a trust network.

Redrob AI Fit

Bharat Score is **a direct extension of Redrob's core product:**

Redrob today	Bharat Score adds
Ranks candidates from structured profiles	Generates structured profiles from unstructured workers
Serves corporate recruiters	Expands TAM to informal sector (contractors, MSMEs)
100K structured candidate pool	+135M previously invisible workers
Signals: skills, experience, OTW flag	New signal: verified tenure + employer rating

This is not a pivot. It's the same ranking engine applied one layer upstream — creating the structured data that Redrob's ranker then uses.

Redrob's existing signals (OTW flag, response rate, interview completion) map directly onto Bharat Score's engagement signals

Go-to-Market: 90-Day Pilot Plan

Phase 1 — Pilot (Days 1–30)

- Partner with **2 construction contractors** in Noida/Pune (Redrob's home base)
- Credential **500 workers** in Hindi + Marathi
- Provide **free recruiter access** to 10 early-adopter MSMEs

Phase 2 — Validate (Days 31–60)

- Measure: time-to-hire, recruiter NPS, worker re-engagement rate
- Target: 60% of hired workers had a Bharat Score vs. none before
- Instrument: did credentialed workers get hired faster?

Phase 3 — Scale (Days 61–90)

- Add Tamil + Telugu assessment tracks

The Ask

We are building Bharat Score as an open credentialing layer for India.

What we need from Redrob AI:

- **API access** to Redrob's candidate signal infrastructure
- **Pilot partnership** with 2–3 of Redrob's enterprise recruiter clients
- **Mentorship** from the Redrob team on recruiter adoption patterns

What Redrob gets:

- First-mover position in informal-sector credentialing
- A new upstream data source that makes the existing ranker dramatically more powerful
- A mission that resonates: helping 450M Indians become visible to the economy

Summary

Bharat Score is a WhatsApp-native AI credentialing system that turns a 5-minute voice conversation into a verifiable work credential for India's 450M informal workers — in 12 languages, with no app, no CV, no friction. For the mason, the gig driver, the data-entry worker in Tier-3 India: **for the first time, their work has a verifiable record.** For Redrob: it creates the structured data upstream that makes the existing ranker work on the largest untapped talent pool in the world.
